

APPENDIX

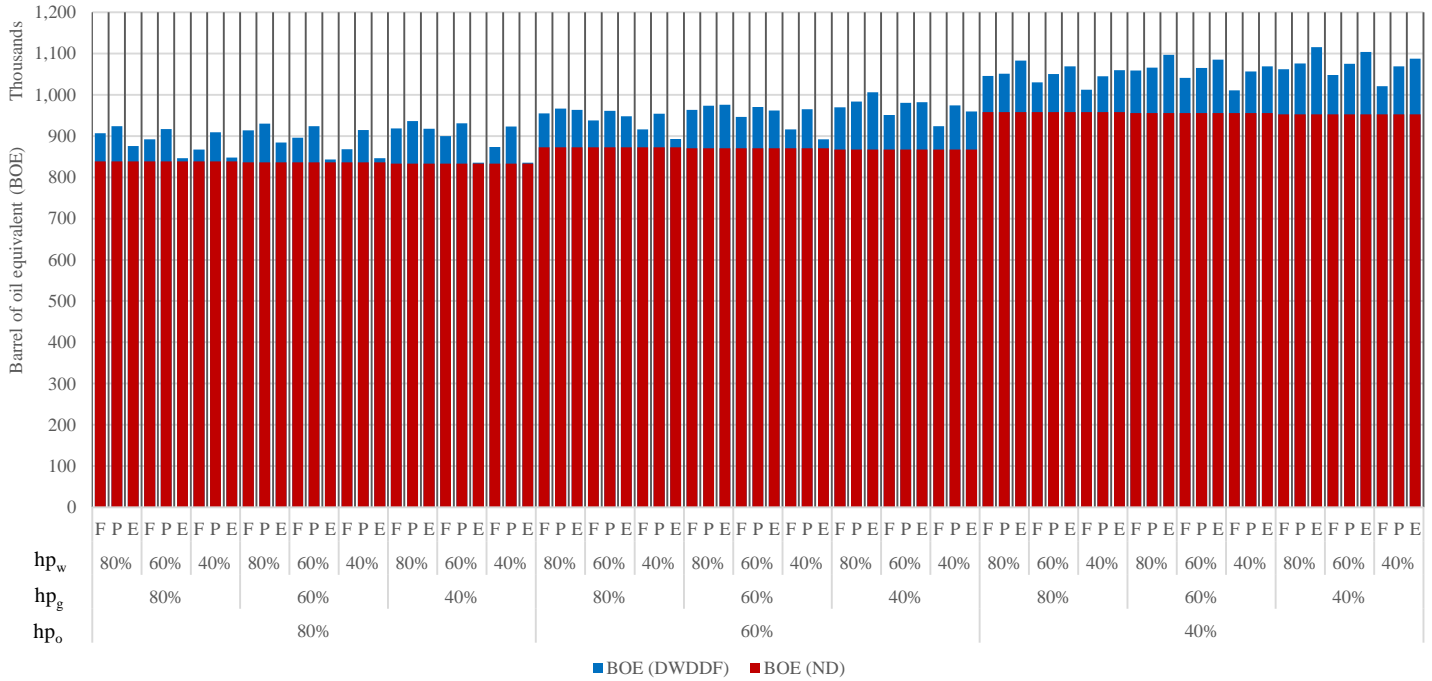

Fig. 9. Total BOE for Bottom-up production and DWDDF at various oil, gas, and water perforation intervals as a function of different starting times for water dumpflood (Note that hp_w, hp_g and hp_o represent perforation intervals of water, gas and oil, respectively whereas F, P, E stands for dumpflood starting time of first day, end of plateau and economic rate).

ACKNOWLEDGMENT

The authors would like to thank Chulalongkorn University for providing graduate scholarship for Htet Myet Zin Naing and Schlumberger Thailand for providing reservoir simulation software used in this study.

Htet Myet Zin Naing is currently a master's student, specializing in petroleum engineering at Chulalongkorn University. He was born in Yangon, Myanmar. He earned a B.E degree in petroleum in 2019 from Technological University (Thanlyin), Yangon, Myanmar.

He has been an SPE member since 2018, and he also served as president of Thanlyin Technological University SPE Student Chapter during the 2018 – 2019 academic term. His research interests include water coning management, water dumpflood, CO₂ EOR and sequestration with the emphasis on reduction not only implementation cost but also harm upon the environment.

Zin Naing received a graduate scholarship award from the Chulalongkorn University's Graduate Scholarship Program for ASEAN and Non-ASEAN Countries in 2020. He was also an exchange student at Chulalongkorn University in 2019 with the contribution of the Chulalongkorn University's One Semester Scholarship Award.

Suwat Athichanagorn is an assistant professor and head of petroleum engineering section at the Department of Mining and Petroleum Engineering, Chulalongkorn University, Thailand. He was an adjunct faculty member at Asian Institute of Technology and Sirindhorn International Institute of Technology. He was also instructor for Thailand Petroleum Training Institute and once served as an Editor in Charge for Geological and Geo-Resource Engineering for ASEAN Engineering Journal.
